

CHAPTER 1 – INTRODUCTION

HTML – HYPER TEXT MARKUP LANGUAGE

HTML is the language of the web. It is used to create websites.

We use HTML tags to define look & feel of a website.

With the understanding of these tags and How to put them together, we can create beautiful websites easily.

Then why CSS & JavaScript

HTML is used for defining layout of a page – A skeletal page structure.

CSS is used to add styling to that skeletal structure of the page.

Javascript is used to program logic for the page layout like what happens when a user hovers on a text, when to hide or show elements etc.

A Beautiful Analogy

- HTML is like a car body (only metal).
- CSS is like the decorative accessories & car paint etc.
- Javascript is like the car engine + interior logic.

Installing VISUAL STUDIO (VS) CODE

We can use any text editor of our choice. Here we are going to use VS Code because it is light weight, open source & from Microsoft.

Go to Google < Type VS code < Download & Install it.

NOTE : *We can write HTML even in Notepad. Text Editor like VS Code just makes these things easier.*
